

RESPIRATORY PROTECTION

Respiratory Protection

Essential for Workplace Safety

Why Respiratory Protection Matters?

Protecting your lungs is crucial for staying safe at work. Whether you're in construction, manufacturing, healthcare, or any other industry, FiltAer™, ProAer™ and ConAer™ range of respiratory protection can prevent serious health issues caused by inhaling harmful substances.

Understanding the Importance

Respiratory hazards, such as dust, fumes, smoke, and chemicals, can cause severe health problems, including lung diseases, asthma, and even cancer. Wearing respiratory protection, like Respirators and respirators, helps filter out these harmful substances, ensuring you breathe clean air.

Choosing the Right Respiratory Protection

Disposable Respirator: Lightweight and convenient for short-term use, these Respirators protect against dust and other particulates.

Half-Facepiece Respirators: Provide a better fit and protection against dust, fumes, and some gases. They require replaceable filters or cartridges.

Full-Facepiece Respirators: Offer complete protection for the face and eyes, ideal for more hazardous environments with higher levels of contaminants.

Powered Air-Purifying Respirators (PAPRs): Use a battery-powered blower to provide a steady flow of filtered air, suitable for long-duration use in high-risk areas.

Supplied-Air Respirators (SARs): SARs deliver clean air from an external source, ideal for hazardous environments or confined spaces where filtering ambient air isn't sufficient.

Self-Contained Breathing Apparatus (SCBA): Provide breathable air from a tank, essential for extremely hazardous environments where the air quality is severely compromised.

Making Safety a Priority

Prioritizing respiratory protection means understanding the risks and choosing the appropriate equipment. It's not just about following workplace rules; it's about protecting your lungs and overall health. Always use the right protection for the job and ensure it fits properly.

EN 140: Half Facepiece for Respiratory Protection

EN 140 is a European standard that specifies the requirements for half facepiece used in respiratory protective devices. These Respirators cover the nose, mouth, and chin (half facepiece) and are used with filters or breathing apparatus to protect against hazardous airborne substances.

Key Aspects of EN 140

● Design and Construction

Materials: Facepiece must be made from durable, non-toxic materials that are comfortable to wear and do not cause skin irritation.

Face Seal: Facepiece must have an effective seal around the face to prevent contaminants from leaking in.

Components: Respirators typically consist of the respirator body, head harness, and connections for filters or other respiratory devices.

● Performance Requirements

Breathing Resistance: Respirators must allow for easy breathing, with minimal resistance to airflow when inhaling and exhaling.

Filter Compatibility: Respirators should be compatible with various types of filters or cartridges depending on the specific hazards present.

Mechanical Strength: Respirators must be robust and able to withstand handling and environmental stresses without degrading.

● Testing and Certification

Leak Tightness: Respirators must be tested to ensure they maintain a tight seal around the face, preventing any contaminants from entering.

Mechanical Performance: Respirators must pass tests for durability and strength, ensuring they can handle impacts and other mechanical stresses.

Flammability: Respirators must be tested to ensure they do not easily catch fire or melt when exposed to high temperatures.

● Comfort and Fit

Adjustability: Respirators must have adjustable head straps to ensure a secure and comfortable fit for different face sizes and shapes.

Weight and Balance: The design should distribute weight evenly to minimize pressure points and increase comfort during prolonged use.

Ease of Use: Respirators should be easy to put on and take off, with simple mechanisms for attaching and detaching filters.

● Marking and Information

Manufacturer's Details: Respirators must be clearly marked with the manufacturer's name, model number, and size.

Compliance: Respirators must display a mark indicating compliance with the EN 140 standard.

User Instructions: Comprehensive instructions for use, maintenance, and cleaning must be provided to ensure proper handling and longevity of the respirator.

Respirator Cartridge Selection: Ensuring Proper Protection

Selecting the right respirator cartridge is crucial for providing adequate protection against specific airborne hazards. Different cartridges are designed to filter out various types of contaminants, including particulate matter, gases, and vapors. Here's a guide to help you choose the right respirator cartridge for your needs.

Steps for Selecting the Right Respirator Cartridge

● Identify the Hazard

Particulate Matter: Dust, fumes, mists, smoke.

Gases and Vapors: Organic vapors, acid gases, ammonia, formaldehyde, etc.

Combination Hazards: Environments with both particulates and gases/vapors.

● Understand Cartridge Types

Particulate Filters:

P1 Filters: Provide protection against low levels of dust and solid particles, suitable for environments with non-toxic dust.

P2 Filters: Offer protection against moderate levels of dust, mists, and fumes, commonly used in construction and industrial settings.

P3 Filters: Provide the highest level of protection against fine particles, including toxic dust, fumes, and asbestos, ideal for high-risk environments.

Gas and Vapor Cartridges:

Organic Vapor (OV): Protects against organic vapors such as solvents and hydrocarbons.

Acid Gas (AG): Protects against acid gases like chlorine, sulfur dioxide, and hydrogen chloride.

Ammonia/Methylamine (AM): Protects against ammonia and methylamine.

Formaldehyde (FM): Protects against formaldehyde vapors.

Combination Cartridges:

Multi-Gas/Vapor: Protects against a variety of gases and vapors.

PAPR Cartridges: Used with Powered Air-Purifying Respirators for extended use and higher comfort levels.

● Consider the Workplace Environment

Contaminant Concentration: Determine the levels of contaminants in the air to choose a cartridge with the appropriate protection factor.

Exposure Duration: Longer exposure may require more robust filtration or the use of powered air-purifying respirators (PAPRs).

Presence of Oils: If the environment contains oil aerosols, choose filters and cartridges rated for oil resistance (R or P series).

● Check Compatibility

Ensure that the cartridge is compatible with your respirator model. Not all cartridges fit all respirators, so refer to the manufacturer's compatibility chart.

● Follow Regulations and Standards

Adhere to guidelines set by occupational safety organizations such as OSHA (Occupational Safety and Health Administration) in the U.S., and ensure the selected cartridge meets relevant standards.

Color Coding for Respirator Cartridges (Based on EN Standard)

In Europe, the color coding for respirator cartridges follows the EN (European Norm) standard, ensuring that users can easily identify the type of protection each cartridge provides. Here is a guide to the color codes used for different types of contaminants according to the EN standard:

• Particulate Filters

White:

P1: Low efficiency filter (80% minimum efficiency) for protection against low levels of fine dusts.

P2: Medium efficiency filter (94% minimum efficiency) for protection against moderate levels of fine dusts, mists, and fumes.

P3: High efficiency filter (99.95% minimum efficiency) for protection against high levels of fine dusts, mists, and fumes, including carcinogenic and radioactive particles, as well as bacteria and viruses.

• Gas and Vapor Cartridges

Brown:

Type A: Organic gases and vapors with boiling points above 65°C (e.g., solvents and hydrocarbons).

Grey:

Type B: Inorganic gases and vapors (e.g., chlorine, hydrogen sulfide, hydrogen cyanide).

Yellow:

Type E: Acid gases (e.g., sulfur dioxide, hydrogen chloride).

Green:

Type K: Ammonia and organic ammonia derivatives.

Red:

Type CO: Carbon monoxide (used with specific devices that have an end-of-service-life indicator).

Blue:

Type NO: Nitrogen oxides

Brown & Green:

Type AX: Organic gases and vapors with boiling points below 65°C (e.g., low boiling point organic compounds). Note: AX filters are single-use only.

• Combination Filters

Brown/White:

A-P: Organic vapors and particulates.

Grey/White:

B-P: Inorganic gases and particulates.

Yellow/White:

E-P: Acid gases and particulates.

Green/White:

K-P: Ammonia and particulates.

Brown/Grey/White:

A-BE-P: Organic, inorganic gases, and acid gases and particulates.

Olive:

A-BE-K-P: Organic, inorganic gases, ammonia, acid gases, and particulates.

• Other Specific Filters

Olive & Red:

A-BE-K-Hg-P: Organic gases and vapors, inorganic gases, ammonia, mercury vapor, acid gases, and particulates.

Important Considerations

• Markings:

Each cartridge or filter should have clear markings indicating its type and the specific contaminants it protects against. Ensure that the markings are visible and legible.

• Expiration Date:

Cartridges have a shelf life, and expired cartridges should not be used. Check the expiration date before use.

• Fit Testing:

Ensure that the respirator with the selected cartridge fits properly. Conduct regular fit tests to ensure a secure seal.

By adhering to the EN standard color coding system, workers can easily select the appropriate cartridge for their specific needs, ensuring they have the necessary protection against various workplace hazards. Proper training and regular updates on cartridge selection and use are crucial for maintaining safety and compliance in the workplace.

Disposable Respirators

ConAer™

Powered Air Purifying
Respirator

PAPR

A Critical Aspect of Workplace Safety

Understanding the Importance of Powered Air-Purifying Respirators (PAPR)

ConAer™ range of Powered Air-Purifying Respirators (PAPR) are essential for protecting workers in environments where air quality is compromised due to hazardous dust, fumes, vapors, or gases. By providing a continuous supply of filtered air, PAPRs enhance safety and comfort, particularly in challenging work conditions.

Why PAPR Matters?

- **Comprehensive Respiratory Protection**

Continuous Air Supply: PAPRs deliver a steady stream of clean, filtered air to the wearer, ensuring a consistent supply of breathable air.

Effective Filtration: Equipped with high-efficiency filters, PAPRs protect against a wide range of contaminants, including particulate matter, gases, and vapors.

- **Enhanced Comfort**

Reduced Breathing Effort: Unlike traditional respirators that rely on the wearer's breathing effort, PAPRs reduce the physical effort required to breathe by actively supplying filtered air.

Cooling Effect: The airflow from a PAPR system helps to keep the wearer cool, reducing heat stress and improving comfort during prolonged use.

- **Improved Safety**

Protection Against High Levels of Contaminants: PAPRs are crucial in environments with high concentrations of harmful substances, where other forms of respiratory protection may be inadequate.

High Protection Factor: PAPRs provide a high level of protection compared to other respirators, ensuring better safety in hazardous work environments.

Key Features of PAPR Systems

- **Filter Types and Efficiency**

Particulate Filters: Capture dust, fumes, and aerosols. HEPA filters are commonly used for high-efficiency particulate air filtration.

Gas and Vapor Filters: Protect against specific gases and vapors. These can include activated carbon filters for gases or specialized filters for specific chemical hazards.

Combination Filters: Some PAPRs use filters that combine both particulate and gas/vapor protection.

- **Airflow Rate**

Flow Rate: The airflow rate of a PAPR system is typically between 170 to 210 liters per minute, ensuring adequate ventilation and comfort.

Adjustability: Some systems allow for adjustable airflow settings to match the wearer's needs and the work environment.

- **Battery Life and Power Source**

Battery Types: PAPRs are usually powered by rechargeable batteries, with some models incorporating solar assists to extend battery life.

Runtime: Battery life should be sufficient for the entire work shift, with easy recharging and replacement options.

- **Comfort and Fit**

Headgear: PAPR systems come with various headgear options, including full-face masks, hoods, and helmets. The choice depends on the level of protection required and comfort preferences.

Adjustability: Ensure the system is adjustable for a secure fit and comfortable use, reducing strain on the wearer.

- **Maintenance and Durability**

Filter Replacement: Regular replacement of filters is essential for maintaining effective protection. Choose systems with easy access for filter changes.

Durability: The PAPR unit and components should be robust enough to withstand the conditions of the work environment.

Key EN Standards for PAPR Systems

● EN 12941 (Respiratory protective devices - Powered air purifying respirators)

Scope:

This standard specifies the requirements for the design, performance, and testing of powered air-purifying respirators used to protect against particulate contaminants.

Requirements:

Performance: Defines the minimum requirements for the protection provided by PAPRs against airborne particles.

Filter Efficiency: Specifies the efficiency of particulate filters (e.g., P3 filters) in removing contaminants from the air.

Airflow Rate: Ensures the PAPR system provides a sufficient airflow rate to maintain comfort and protection.

Comfort: Addresses aspects such as the fit and comfort of the PAPR system to ensure it can be worn effectively for extended periods.

Leakage: Tests for the ability of the PAPR system to prevent leakage of contaminants into the breathing zone.

Maintenance: Includes requirements for the maintenance and durability of the PAPR system, including ease of filter replacement.

Key points about EN 12941 include:

● Types of Devices:

The standard covers powered air-purifying respirators (PAPRs) that consist of a motor-driven fan unit that draws in contaminated air, passes it through a filter, and supplies clean air to the helmet or hood.

● Protection Classes:

There are different protection classes defined by the standard, typically denoted as TH1, TH2, and TH3. These classes indicate the level of protection provided by the device:

TH1: Lowest level of protection.

TH2: Intermediate level of protection.

TH3: Highest level of protection.

● Performance Criteria:

The standard outlines various performance criteria that the devices must meet, including:

Breathing resistance.

Filter efficiency.

Battery performance (for powered devices).

Field of vision for the wearer.

Inward leakage tests to ensure the device effectively seals against the wearer's face.

PAPR Filter Schematic

Constant air supply design delivers constant airflow even if battery is low or filter is clogged. Lightweight, portable, and easy-to-use, providing excellent respiratory protection.

01 Durable front cover

Protects blower unit from being damaged by high temperature and high-speed impact objects.

02 Spark screen

Blocks metal splashes from igniting other filter components.

03 Pre-filter

Blocks large particles and prolong service life of particle filter.

04 Particle filter

High-efficiency particle filter, filtration efficiency up to 99.997%.

05 Gas filter

Optional ABEK1 / A1 / A2 for protection against organic, inorganic and acid gas vapors, gas filter sold separately.

06 Odor filter

Eliminates unpleasant odors (not required if a gas filter is installed), odor filter sold separately.

07 Fast rechargeable lithium battery

Standard battery can be fully charged within 1.2 hours, battery duration is 10 hours (170L/min airflow rate). Optional extended battery can be fully charged within 2.5 hours, battery duration is 19 hours (170L/min airflow rate).

08 High quality brushless motor

Low power consumption, long service life, high static pressure and low noise.

09 Optional airflow rates

Two levels of airflow rate (170L/min and 210L/min) available.

10 Hose

Connect respirator and welding helmet, delivering clean helmet for clean air delivery.

CA2100

CE 2834 EN 12941

Triple-Alarm System

The warning light will flicker to indicate clogged filter or low battery, while the respirator will sound an alarm and vibrate.

Real-Time Monitoring

Real-time monitoring displays the air-flow, battery power, particle filter loading for the user.

Battery Indicator

Filter Warning

ON / OFF Button

Airflow Indicator

Various Filter Options

User can choose P3/gas/odor filter according to different applications and work environments.

Intelligent Control

Respirator motor automatically adjusts the power and air-flow depending on the filter box loading.

High-Performance Motor

High-quality brushless motor, strong air volume, low power consumption, ultra-quiet running and up to 3 times longer motors life.

Powered Air Purifying Respirator - Turbo Unit

Product Specification

Air Flow Rate (Low speed)	170+lpm
Air Flow Rate (High speed)	210+lpm
Battery type	Rechargeable Li-ion battery
Charge time	1 hour
Battery life	At least 500 charges
Fast Charging Std Battery duration	9 hours at 170+lpm; 5-6 hours at 210+lpm
Fast Charging Heavy Dusty Battery duration	15 hours at 170+lpm; 9 hours at 210+lpm
Weight	1020g (Turbo Unit + Fast Charging Standard Battery)
Filter efficiency	> 99.997%
Operating temp.	-5°C to 55°C
Storing temp.	-10°C to 55°C
Relative operating humidity (R.H.)	< 90%
Relative storage humidity (R.H.)	< 85%
Alarm	Audible, Visible, Vibration

Packaging Information

1 Set / Box

Package Includes

- Turbo Unit x 1
- Fast Charging Standard Battery x 1
- Battery Charger x 1
- P3 Filter (TH3 P Filter) x 1
- Standard Waist Belt x 1

Product SKU	Product Description	Inner pack UPC
BLSH-CA-2100	PAPR Systems with standard waist belt	810148536879

Powered Air Purifying Respirator

ConAer™ Series

CA2100-ECB

CE 2834 EN 12941

The CA2100-ECB ConAer Powered Air Purifying Respirator (PAPR) is engineered for pharmaceutical environments, offering high-efficiency respiratory protection without compromising on comfort or hygiene.

Packaging Information

1 Set / Box

Package Includes

Turbo Unit x 1
Fast Charging Standard Battery x 1
Battery Charger x 1
Particle Filter (TH3 P Filter) x 1
Easy Clean Belt x 1
Std. Breathing Tube x 1
Breathing Tube White Sleeve x 1
Soft Hood x 1

Powered Adaptive Respirator

Airflow adjusts according to breathing frequency

Product Specification

Air Flow Rate	Adaptive Breathing (Tested at No Less Than 65 lpm)
Noise Level	60dB
IP Rating	IP54
Indicators	Low Battery Indicator, Sound and Light Alarm, Electromagnetic Compatibility
Operating temp.	-5°C to 55°C
Storage temp.	-10°C to 65°C, 20% to 80% RH
Std Battery duration	>8 hours
Heavy-Duty Battery duration	>12 hours
Charging time for Std Battery	4.5 hours
Charging time for Heavy-Dusty Battery	6.5 hours
Battery life	At least 500 charges
Main unit protection	IP54; the unit complies with intrinsic safety standards (ExIIIC / ExIIIC)
Particulate filter standards	CE: TM3, GB: P100
Gas filter standards	GB/CE: A1/A1B1E1K1
Leakage rate	≤2%
Inhalation resistance	≤350 Pa (when powered on)
Exhalation resistance	≤700 Pa (when powered on)

ConAer™

Half Face Intelligent
Powered Air Purifying Respirator

HYBRID
TECHNOLOGY

CA100

Single Stage Filtration Supplied Air Respirators

ConAer - CA100 Filter and Regulator Panel is a compressed breathing air purifier system designed to help Applications remove or reduce selected contaminants that are found in standard compressed airlines.

Specification

Inlet pressure (max.)	150 psi static
Rated air flow (max.)	50 scfm (1416 L/min) at 105 psi
Inlet pressure (recommended)	90 to 120 psi (6.2-8.3 bar)
Outlet pressure range	0 to 115±5 psi (0 to 7.2±0.34 bar)

1. Air Entry:

- Air entering the filtration system at the inlet may be contaminated with oil, water, dirt, rust, scale and vaporous hydrocarbons.
- Air enters the panel through the Air Inlet-On/Off Valve (A). When the On/Off handle is down, airflow is restricted from entering the SAR filter assembly.

2. Single Stage Filtration:

- The Filter and Regulator Panel contains a single filter (B) embedded with carbon layer designed to remove liquid, particles and nuisance levels of odour.
- Liquid contaminants are trapped in the filter assembly and expelled through the drain valve (C).

3. Pressure Regulator:

The air is then passed through the air pressure regulator (D), which is used to adjust the air pressure going to the respirators.

- Maximum capacity of 50 cfm at 105 psi,
- Require a source of clean breathing air such as compressed air systems or bottled air
- No batteries to maintain
- Cost effective respiratory protection for All-Day use

4. Outlet Valve:

- Three standard quick coupling (E) are ready to supply air to helmets, hoods or tight-fitting facepieces.
- Quick couplings are incompatible with outlets for other gas systems to prevent inadvertent servicing of airline respirators with non-respirable gases or oxygen.
- Various pre-assembled hose kit can connect to the filter panel quick coupling.

5. Pressure Relief Valve:

- The final component of the panel, the pressure relief valve (F), prevents pressure at the hose connection from exceeding 110 psi (± 5 psi).

CA300A & CA 300M

Three Stage Filtration Supplied Air Respirators

ConAer - CA300 Series Filter and Regulator Panel is a compressed breathing air purifier system designed to help remove or reduce selected contaminants that are found in standard compressed airlines.

Specification

Inlet pressure (max.)	150 psi static
Rated air flow (max.)	50 cfm (1416 L/min) at 105 psi
Inlet pressure (recommended)	90 to 120 psi (6.2-8.3 bar)
Outlet pressure range	0 to 115±5 psi (0 to 7.2±0.34 bar)

1. Air Entry:

- Air entering the filtration system at the inlet may be contaminated with oil, water, dirt, rust, scale and vaporous hydrocarbons.
- Air enters the panel through the Air Inlet point 1/2" female thread port (A).

2. Three Stage Filtration:

- The Filter and Regulator Panel contains three filters (B) designed to remove liquid droplets, particles, and nuisance odors.
- Liquid contaminants are trapped in the filter assembly and expelled through the auto drain valve (CA300A) or Manual (CA300M) (C).
- It contains air pressure regulator (D), which is used to adjust the air pressure going to the respirators.

3. Filter Panel

- Maximum capacity of 50 cfm at 105 psi,
- Require a source of breathable compressed air system or air cylinder
- No battery requirement to maintain
- Cost-effective respiratory protection for All-Day use

4. Couplings:

- It has CEJN 342 series quick couplings (E) that ensure to supply breathing air to helmets, hoods or tight-fitting facepieces.
- Quick couplings are compatible with Bisonlife provided breathing air hose for SAR application only.

5. Filter Elements:

5 μ m Brass filter element (CA301B): Excellent filtration performance, longer life and possibility to reuse

0.5 μ m filter element (CA301C): Effective filter out smaller particles and coalescing filter effect to eliminate water & oil droplets from the air stream.

0.01 μ m filter element (CA301P): Effective filter out the smallest particles and odor from the air stream.

CA301C

CA301P

Supplied Air Respirators

CA300AFI

Three Stage Filtration Supplied Air Respirators

ConAer - CA300AFI Filter and Regulator Panel is a compressed breathing air purifier system designed to help remove or reduce selected contaminants that are found in standard compressed airlines.

Specification

Inlet pressure (max.)	150 psi static
Rated air flow (max.)	50 cfm (1416 L/min) at 105 psi
Inlet pressure (recommended)	90 to 120 psi (6.2-8.3 bar)
Outlet pressure range	0 to 115±5 psi (0 to 7.2±0.34 bar)

1. Air Entry:

- Air entering the filtration system at the inlet may be contaminated with oil, water, dirt, rust, scale and vaporous hydrocarbons.
- Air enters the panel through the Air Inlet point 1/2" female thread port (A).

2. Three Stage Filtration:

- The Filter and Regulator Panel contains three filters (B) designed to remove liquid droplets, particles, and nuisance odors.
- Liquid contaminants are trapped in the filter assembly and expelled through the auto drain valve (C) manual drain valve (D).
- It contains air pressure regulator (D), which is used to adjust the air pressure going to the respirators.

3. Filter Panel

- Maximum capacity of 50 cfm at 105 psi,
- Require a source of breathable compressed air system or air cylinder
- No battery requirement to maintain
- Cost-effective respiratory protection for All-Day use

4. Couplings:

- It has CEJN 342 series quick couplings (E) that are ensure to supply breathing air to helmets, hoods or tight-fitting facepieces.
- Quick couplings are compatible with Bisonlife provided breathing air hose for SAR application only.

5. Filter Elements:

5 µm Brass filter element: Excellent filtration performance, longer life and possibility to reuse

0.5 µm filter element: Effective filter out smaller particles and coalescing filter effect to eliminate water & oil droplets from the air stream.

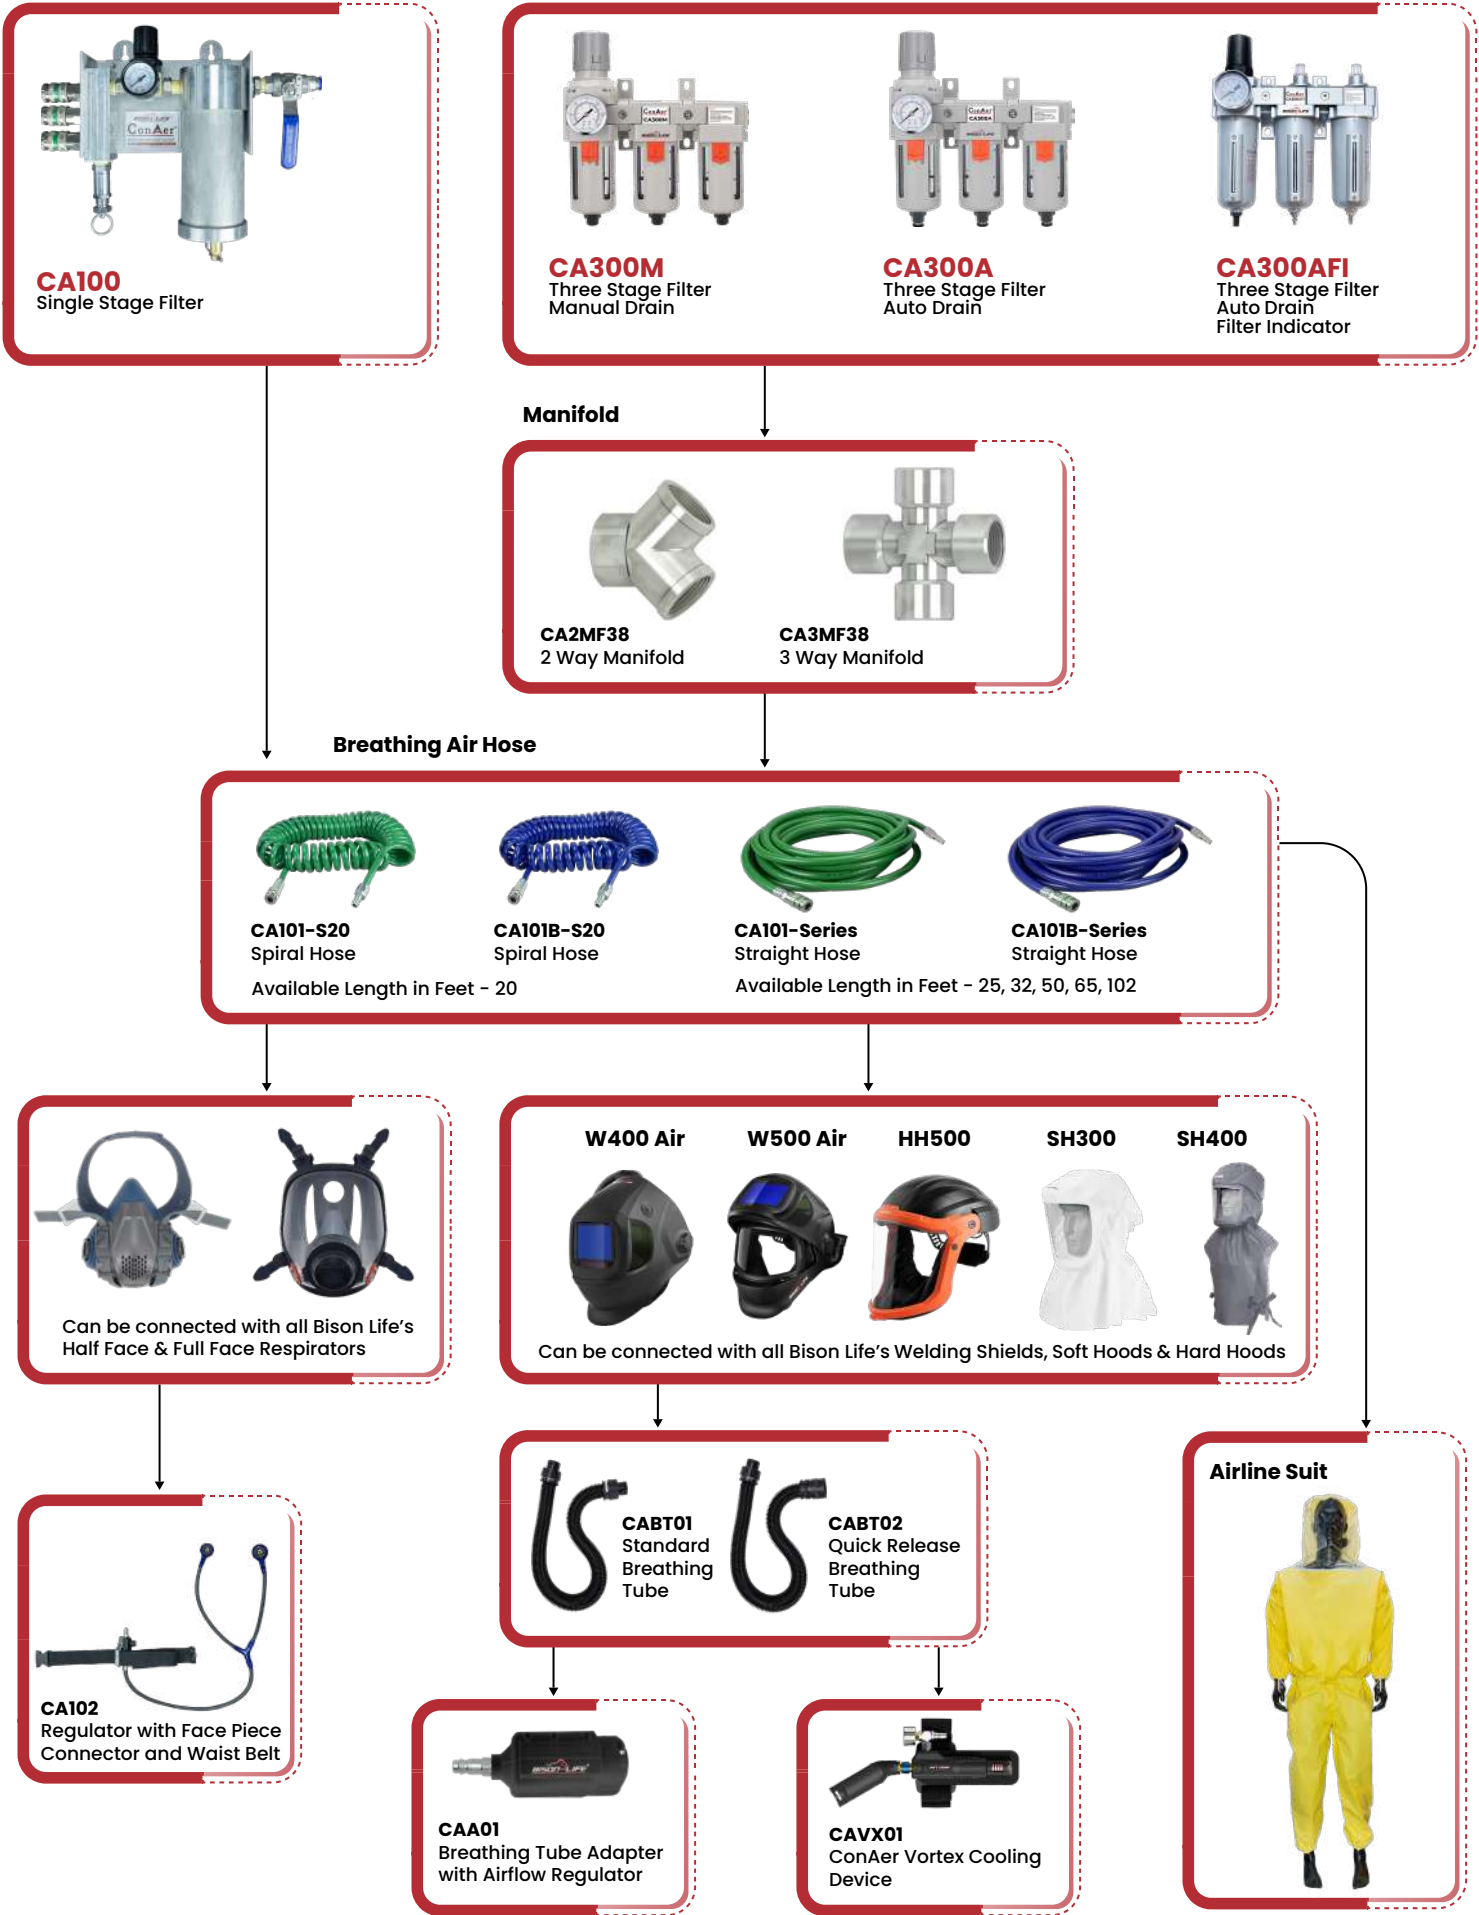

0.01 µm filter element: Effective filter out the smallest particles and odor from the air stream.

6. Filter Change Indicator:

- The filter change indicators (G) signals when the filter element needs to be replaced.
- Whenever the red indicator pops up, the element must be replaced.
